1.IMPORT REQUIRED LIBRARIES

Import libraries for:

• text preprocessing

• tokenization

• counting N-grams

• probability calculations

```
import re
import string
import nltk
from nltk.corpus import stopwords
from nltk.stem import PorterStemmer, WordNetLemmatizer
from nltk.tokenize import word_tokenize, sent_tokenize
from nltk.util import ngrams
from collections import Counter
import numpy as np
import pandas as pd
import math
```

2.LOAD DATASET load or copy text corpus

• clean unnecessary lines

• display sample text

• explain dataset in 5–6 lines

```
import nltk
nltk.download('gutenberg')
from nltk.corpus import gutenberg

# Load a sample text (Jane Austen's Emma)
raw_text = gutenberg.raw('austen-emma.txt')
import re

# Remove extra whitespace
clean_text = re.sub(r'\s+', ' ', raw_text)

# Remove non-alphabetic characters (optional)
clean_text = re.sub(r'[^a-zA-Z\s]', '', clean_text)

print(clean_text[:500])  # Display first 500 characters
```

```
Emma by Jane Austen  VOLUME I CHAPTER I Emma Woodhouse handsome clever
and rich with a comfortable home and happy disposition seemed to unite
```

```
some of the best blessings of existence and had lived nearly twentyone
years in the world with very little to distress or vex her She was the
youngest of the two daughters of a most affectionate indulgent father
and had in consequence of her sisters marriage been mistress of his
house from a very early period Her mother had died too long ago for
her to hav

[nltk_data] Downloading package gutenberg to /root/nltk_data...
[nltk_data]   Package gutenberg is already up-to-date!
```

3.PREPROCESS TEXT Write functions to:

• convert to lowercase

• remove punctuation and numbers

• tokenize words

• optionally remove stopwords

• add start/end tokens for sentences (e.g., ,)

```
#convert to lowr case
def to_lowercase(text):
    return text.lower()
# remove punctuation and numbers
def remove_punctuation_numbers(text):
    # Remove punctuation
    text = text.translate(str.maketrans('', '', string.punctuation))

    # Remove numbers
    text = re.sub(r'\d+', '', text)
    return text
#tokenise the words
def tokenize_words(text):
    return word_tokenize(text)
#removing the stop words
def remove_stopwords(tokens, remove=True):
    if not remove:
        return tokens

    stop_words = set(stopwords.words('english'))
    filtered_tokens = [word for word in tokens if word not in
stop_words]

    return filtered_tokens
# add start/end tokens for the sentences
def add_sentence_tokens(text):
    sentences = sent_tokenize(text)

    processed_sentences = []
```

```
    for sentence in sentences:
        tokens = word_tokenize(sentence)
        tokens = ['<s>'] + tokens + ['</s>']
        processed_sentences.append(tokens)

    return processed_sentences
```

4.BUILD N-GRAMS MODELS

• construct Unigram

• construct Bigram

• construct Trigram

```
#UNIGRAM MODEL
def build_unigram(tokens):
    """
    tokens: list of words
    returns: dictionary of unigram counts
    """
    return Counter(tokens)
# BIGRAM MODEL
def build_bigram(tokens):
    """
    tokens: list of words
    returns: dictionary of bigram counts
    """
    bigrams = ngrams(tokens, 2)
    return Counter(bigrams)
# 3 TRIGRAM MODELS
def build_trigram(tokens):
    """
    tokens: list of words
    returns: dictionary of trigram counts
    """
    trigrams = ngrams(tokens, 3)
    return Counter(trigrams)
```

COUNT TABLES Create tables showing:

• word counts

• conditional probabilities

```
import nltk
nltk.download('punkt_tab')

# PREPROCESS TEXT TO GET TOKENS
processed_text = to_lowercase(clean_text)
```

```
processed_text = remove_punctuation_numbers(processed_text)
tokens = tokenize_words(processed_text)
# Optionally remove stopwords if desired
# tokens = remove_stopwords(tokens, remove=True)

# UNIGRAM MODEL
unigram_counts = build_unigram(tokens)
unigram_table = pd.DataFrame(
    unigram_counts.items(),
    columns=["Word", "Count"]
).sort_values(by="Count", ascending=False)

print("UNIGRAM TABLE:")
print(unigram_table.head())
print("\n")

# BIGRAM MODEL
bigram_counts = build_bigram(tokens)
bigram_probabilities = []

for (w1, w2), count in bigram_counts.items():
    # Ensure w1 exists in unigram_counts to avoid division by zero or
KeyError
    if unigram_counts.get(w1, 0) > 0:
        prob = count / unigram_counts[w1]
        bigram_probabilities.append((w1, w2, count, prob))
    else:
        # Handle cases where w1 might not be in unigram_counts (e.g.,
start tokens, or very rare words)
        bigram_probabilities.append((w1, w2, count, 0.0)) # Assign 0
probability or handle as appropriate

bigram_table = pd.DataFrame(
    bigram_probabilities,
    columns=["Previous Word (w1)", "Next Word (w2)", "Bigram Count",
"P(w2|w1)"]
).sort_values(by="Bigram Count", ascending=False)

print("BIGRAM TABLE:")
print(bigram_table.head())
print("\n")

# TRIGRAM MODEL

6.SENTENCE PROBABILITY PREDICTION

• choose at least 5 sentences

• compute probability using:

o Unigram model

o Bigram model

o Trigram model

```
# Define N (total number of words in the corpus)
# This should be calculated after unigram_counts is built in a prior cell.
# The kernel state confirms unigram_counts is available.
N = sum(unigram_counts.values()) # total number of tokens (words)

# Helper functions for individual n-gram probabilities with Laplace smoothing
# (These compute P(word), P(w2|w1), P(w3|w1,w2) respectively)
def get_unigram_word_prob(word):
    """Calculates P(word) with Laplace smoothing."""
    return (unigram_counts.get(word, 0) + 1) / (N + V)

def get_bigram_conditional_prob(w1, w2):
    """Calculates P(w2|w1) with Laplace smoothing."""
    # Denominator is Count(w1) + V
    return (bigram_counts.get((w1, w2), 0) + 1) / \
           (unigram_counts.get(w1, 0) + V)

def get_trigram_conditional_prob(w1, w2, w3):
    """Calculates P(w3|w1, w2) with Laplace smoothing."""
    # Denominator is Count(w1, w2) + V
    return (trigram_counts.get((w1, w2, w3), 0) + 1) / \
           (bigram_counts.get((w1, w2), 0) + V)

# Functions to calculate sentence probabilities
def calculate_sentence_unigram_prob(sentence_tokens):

```

8.COMPARISON AND ANALYSIS

1.Which model gave lowest perplexity?

A:Usually, the trigram model gave the lowest perplexity because it looks at two previous words, so it understands context better.

2.Did trigrams always perform best?

A:No, not always. Trigrams work best when the sentence pattern was already seen in training. If the data is small or the sentence is new, trigrams can perform worse than bigrams.

3.What happens when unseen words appear?

A:If a word was never seen in training:

Without smoothing → probability becomes 0 → perplexity becomes infinite.

With smoothing → probability becomes very small, but not zero → model still works.

Unseen words increase perplexity.

4.How did smoothing affect results?

A:Smoothing: Prevented zero probabilities, Made perplexity finite, Made the model more stable, But it slightly reduces probabilities of common words.
